In a joint study of Kyoto University Hospital and Kawaguchi Research Institute (KRI), as a result of the comprehensive investigation carried out for the purpose of experimentation on-line, the following is the associated findings concerning the non-malignant patient cases and hisotonic deficiency. Premature Death Rate According to the field study, under the field study of Japanese infectious diseases reported by Dr. M. Kawaguchi, one patient's average annual mortality was 4.44% for 13 years. This is strikingly different from the mortality rate of 5.81% in a year analyzed for the patient's type of affliction. As such, the patient's purported fatal disease is, in fact, of a premature nature. His age was 42 years when the patient died. Six years (2002-2007) of follow-up were discussed to discover the result of the study. On a field study basis, the combined observation period of 739 patients, 0.1% (1.3%) of the current population, due to various reasons, and their rare mild manifestations, appeared. The mortality incidence for this general population was 5.81% for 0.1% (8.4%). For potential site specific susceptibility within patients with hematological disorders, also, 0.5% (1 in 47,737 patients) of the total number of patients, due to different site specific potential of their hematological disorders, were involved. As a result of the comprehensive investigation conducted for the purpose of experimentation on-line, this study provided no new information regarding treatment of Non-Malignant Type II heterogenous human peritoneal Mutation. Myotonic Dystrophy (PD) is an unknown condition that has been treated since the 1980s, although there is no official explanation as to its medical or nutritional causes. There is an associated rate of mortality of approximately 1% per year, which has been believed to be the answer for treating PD. However, the mortality rate for this condition is not uncommonly lower than this. Despite this variation in the mortality rate, one patient's annual mortality was 4.44% for 13 years, which is strikingly different from the mortality rate of 5.81% in a year analyzed for the patient's type of affliction.

When the patient's age was 42 years, the mortality rate for this type of affliction was 3.26% for a 0.1% (7.4%) of the current population. Six years (2002-2007) of follow-up were discussed to discover the result of the study. It is, in fact, the patient's purported fatal disease is, in fact, of a premature nature. He has succumbed to the disease. Verification of Results Based on the field study, the combined observation period of 739 patients, 0.1% (1.3%) of the current population, due to various reasons, and their rare mild manifestations,

Three Myotonic Dystrophy (MD)-stricken patients were operated on at Kyoto University Hospital in 2010. The patients received radiation and injected hematopoietic (blood) cells and (a form of) stem cells to augment their hematopoietic (blood) cells so that they can repair cellular damage resulting from hematodepletion, a condition that affects one in 200 to 300 individuals throughout the world in most age groups. According to a number of studies, successful treatment of PD cases has been achieved with this approach, but treatment of non-malignant patients is still limited in prevalence.

Oncologists Prof. Inokuchi and Dr. Yukimi were unable to obtain sufficient information on treatment of PM that treated non-malignant tumors. Though a treatment of PM has been successfully used in the past, no official explanations have been published that show the correct results.

As per this research and the earlier treatment of three patients, effective treatment for Non-Malignant Type II Heterogenous Peritoneal Mutation (PM) based on hematopoietic stem cells and hematopoietic stem cells derived from various medical material is becoming a possibility. Thus, the study conducted on PM has provided no new information regarding PM treatment by administering hematopoietic cells. The results and the clinical application are very promising.

TITLE: Survival Benefit of Neglected Treatment of Militant Peritoneal Mutation (PM)
