Spreading the word on the anti-vaxx front is a tall order, especially considering the boiling controversy that vaccines are running at the moment. Even by the standards of the madcap, anti-vaxx environment that most of us have come to accept, it is probably the craziest thing that I have ever read or heard come across (cough, cough) – a supplement for certain cancers (ingested full, untastemakers-with-the-draws-too-expensive-to-expect-nowhere and selectively), and a bicycle to get around people who lack a compass?

I donâ€™t want to go out on a limb and say the answer to all that is probably –none of the above– but the folks at Compugen seem to have a few off-the-wall ideas coming out, like this seemingly ingenious, but seemingly pie-in-the-sky idea. You can read about this in their new book –Vaccine Investor–. The idea behind this new approach is that all cancers really form a secondary tumour of the blood system – a blood cancer. Not that there is a general aversion to such –dirty water– but there are a lot of reasons to be scared of it.

These blood cancers are thought to stem from a surge of untreatable hemoglobin or white blood cells in the bloodstream of our immune system. An autoimmune attack? Looking at the trademark Toll-like receptor 5 proteins in the bloodstream (and in malignant cells in the tumor, note) one can draw conclusions. In the near to medium term the anti-vaxx crowd are going to have a significant argument here; if I read the Compugen description of this strategy correctly, this will actually help the anti-vaxx crowd counter the currently touted conventional vaccine theory. Of course, this is all based on only a few pieces of an explanation so it is just speculation at this stage.
