These smart technologies have been described as â&ehigh-performance phonesâ&, â&esmart carsâ&, â&esmart radiationâ&, â&esmart traffic controlâ&, â&esmart transitâ&, â&esmart power generationâ&, â&esmart power distributionâ&, â&esmart chemistryâ&, â&esmart constructionâ&, â&esmart finding of goodsâ&, â&esmart managing of energyâ&, â&esmart traffic control of the larger streetsâ&, and â&esmart air quality monitoring and controlsâ&. The sector categorized as mobile is directly integrated and serves as the hardware of various smart technologies.

In the depth report, we review the technological capacities and economic implications of SMART technology processes related to semiconductors, hard disk drives, servers, grid storage, smart cities, smart bonds, smart infrastructure, smart transit, and power electronics. For a detailed description of "smart demand managementâ€, read "Smart grid smart grid use and applicationâ€.

The low-power, low-energy use of the mobile sector has been identified as one of the most promising vehicles for innovation and economic growth. The report explores the evolution of the commercialization of SMART technology and proposes recommendations that can guide smart technology innovation and economic growth for the future.

The report is available here.
